Continuous Assessment PART 1

Marketing Plan

Each group (consisting of **4 to 5 members**) is required to develop a **one-year marketing plan** for an organisation, brand, or product in the **AI & Smart Technologies sector**, based in a **specific country**. The marketing plan should explore how the chosen organisation can achieve business growth by applying **ONE of** the four strategies from Ansoff's Matrix**:**

- Market Penetration
- Market Development
- Product Development
- Diversification

Task Requirements

Introduction -Background to the Company/Brand/Product

Situational Analysis-Conduct a **strategic audit** of the organisation's current marketing environment. Use appropriate models and frameworks to assess both the **internal and external environment**, such as: PESTLE Analysis, 5 Forces, and SWOT Analysis

Objectives - SMART marketing objectives that will support business growth and which align with the existing corporate mission and objectives.

Strategy- Strategic options to achieve the stated objectives, including a consideration of the STP Process

Tactics- A detailed, tactical marketing mix to support delivery of the selected strategic options

Reference Lists –Minimum 10 academic, industry or other relevant sources

Report Requirements

Write a report (maximum 3000 words, not including cover page or exhibits).

Use Times New Roman, size 12, with 1.5 line spacing and one-inch margins.

The cover page must list all group members' names and student numbers.

Harvard Referencing

1. Introduction (Suhith)

Grab Holdings Limited began in Malaysia in 2012 as MyTeksi. It has since expanded into one of the leading superapps in Southeast Asia, offering services such as ride hailing, food delivery, grocery delivery, digital payments and financial services through a single platform (Grab, 2026). To improve customer experience and strengthen its digital ecosystem, Grab recently introduced the Grab AI assistant. The AI assistant is designed to help users carry out daily tasks more efficiently by providing personalised recommendations, helping users search for food and services. Thus, allowing them to access different Grab features through simple conversations (Grab, 2026). The launch of this feature reflects Grab's efforts to use artificial intelligence (AI) to create a more convenient and personalised experience for its customers.

Singapore is a suitable market for the Grab AI assistant because of its strong digital infrastructure and high level of technology adoption. Singaporeans are highly connected through smartphones and are generally open to using digital services that make everyday activities more convenient. Since Grab already has a strong presence in Singapore through its transport, food delivery, and payment services, the company can introduce the AI assistant to a large existing customer base without needing to enter a new market. This allows Grab to test and improve the feature while encouraging users to spend more time within the Grab ecosystem.

Based on Ansoff's growth matrix, the most appropriate strategy for Grab AI assistant in Singapore is market penetration. Market penetration refers to increasing sales or usage of existing products and services within an existing market. In this situation, Grab is not expanding to a new country or targeting a completely new customer group. Instead, it is

encouraging its current users in Singapore to make greater use of Grab's existing services through the addition of the AI assistant.

The market penetration strategy is suitable for several reasons. First, Grab already has a strong brand reputation and a large customer base in Singapore. This makes it easier to promote the AI assistant to users who are already familiar with the platform. Second, the AI assistant can improve customer engagement by making the app more user friendly and personalised. For example, users can receive recommendations that better match their preferences, which may encourage them to order food, book rides, or use other Grab services more often. Finally, increased engagement can lead to higher customer retention and more frequent transactions, helping Grab strengthen its position in the Singapore market. Therefore, market penetration is the most appropriate strategy for the introduction of the Grab AI assistant in Singapore.

3. Internal Analysis and SWOT/TOWS (Dion)

3.1 Internal Analysis

This section assesses Grab's internal position using four building blocks from the Business Model Canvas: key resources, key activities, key partners and cost structure (Osterwalder and Pigneur, 2010). Exhibit 3 summarises the findings.

3.1.1 Key resources

Grab's scale and local operating data are important resources. It reached a record 54 million regional monthly transacting users in Q2 2026, while its Intelligence Layer draws on insights from 20 billion rides and orders (Grab, 2026a; Grab, 2026b). This may help Grab provide locally relevant recommendations, although data volume alone does not prove that its AI is more accurate than competitors'. Revenue increased 22% year-on-year to US$997 million, and Grab raised its full-year outlook (Grab, 2026b). This suggests capacity to invest, but not a dedicated campaign budget.

3.1.2 Key activities

Grab has invested in AI development, opening an AI Centre of Excellence in 2025 and presenting 13 AI-powered experiences at GrabX 2026 (Grab, 2025; Grab, 2026a). Its Early Access Programme has around 200,000 members, who have contributed 4,000 feature improvements (Grab, 2026a). This supports testing and feedback, although mainstream adoption remains unproven.

3.1.3 Key partners

Grab developed AI Call-A-Ride with OpenAI and tested it with participants in digital-inclusion activities, including workshops organised by IMDA's SG Digital Office (Grab, 2026c). These partners provide technology expertise and access to potential users, but reliance on an external AI provider creates some dependence on its technology and service quality.

3.1.4 Cost structure and limitations

Grab reported US$706 million in total incentives in Q2 2026, partly reflecting support for driver-partner earnings and targeted user investments (Grab, 2026b). This indicates that incentives are significant, so Grab AI should be evaluated on whether it increases usage without requiring excessive extra spending. Grab has not published adoption figures for these AI tools. AI Call-A-Ride's initial trial handled around 1,000 pilot calls and is currently optimised for English and Chinese (Grab, 2026c), so reliability and demand at scale remain unproven.

Exhibit 3: Internal analysis using selected Business Model Canvas building blocks and limitations

Building block	Evidence	Assessment
Key resources	54m regional monthly transacting users; Intelligence Layer drawing on 20bn rides and orders; Q2 2026 revenue of US$997m (+22%) (Grab, 2026a; Grab, 2026b)	Strength: scale, local data and financial capacity. Data volume alone does not prove recommendation quality.
Key activities	AI Centre of Excellence (2025); 13 AI-powered experiences at GrabX 2026; Early Access Programme with 200,000 members and 4,000 feature improvements (Grab, 2025; Grab, 2026a)	Strength: investment in AI development, testing and user feedback.
Key partners	OpenAI collaboration; testing through digital-inclusion activities including IMDA SG Digital Office workshops (Grab, 2026c)	Strength: technology expertise and access to users. Limitation: reliance on an external AI provider.
Cost structure	US$706m total incentives in Q2 2026, partly reflecting driver-partner earnings support and targeted user investments (Grab, 2026b)	Risk: incentive spending is significant; campaign effectiveness should be measured.
Limitations	No published adoption figures; AI Call-A-Ride trial handled around 1,000 pilot calls and is optimised for English and Chinese (Grab, 2026c)	Limitation: demand and reliability at scale remain unproven.

Source: group analysis based on Osterwalder and Pigneur (2010) and cited company sources.

3.2 SWOT and TOWS Analysis

Exhibit 4 combines these internal findings with key external factors in Singapore. Grab's data, existing user base and development experience provide a base for growth. However, limited published adoption data, language constraints and external-provider dependence could slow adoption. Rising generative AI use and Singapore's ageing population create opportunities (Williams, 2025; National Population and Talent Division, 2025), while trust concerns and competitor AI integrations present threats (Williams, 2025; TNGlobal, 2026b).

The TOWS matrix in Exhibit 5 translates these findings into actions (Weihrich, 1982). For S–O, promote Grab AI in the app and use local data to make suggestions more useful. For

W–O, run demonstrations and use Early Access members and community sessions to raise awareness and collect feedback. For S–T, highlight Grab's ability to complete orders and bookings within its platform, with confirmation before payment. For W–T, use a staged roll-out, disclose when users interact with AI and resolve errors quickly, including refunds where appropriate. These actions mainly target existing customers and use Grab's current platform, keeping the focus on Market Penetration.

Exhibit 4: SWOT analysis

Strengths	**Weaknesses**
• 54m regional monthly transacting users and data from 20bn rides and orders (Grab, 2026a; Grab, 2026b) • Reported 69% share of Singapore's food-delivery market (TNGlobal, 2026a) • Can complete orders and bookings within its platform; Early Access Programme has 200,000 members and 4,000 feature improvements (Grab, 2026a)	• No published usage figures; adoption and reliability at scale remain unproven • AI Call-A-Ride is currently optimised for English and Chinese and had an initial trial of around 1,000 calls (Grab, 2026c) • Dependence on external AI providers and significant platform-wide incentive costs (Grab, 2026b; Grab, 2026c)

Opportunities	**Threats**
• Generative AI use among Singaporean online adults rose from 44% to 49% (Williams, 2025) • 20.7% of citizens were aged 65+ in 2025; voice booking may help people who find apps difficult to navigate (National Population and Talent Division, 2025; Grab, 2026c) • Scope to test personalised offers and cross-selling across rides, food and groceries with existing users	• Low AI knowledge and concern about online scams: only 26% felt knowledgeable about AI, while 74% were concerned about scams (Williams, 2025) • Foodpanda offers restaurant discovery through ChatGPT and Claude, while checkout remains on its own platform (TNGlobal, 2026b) • Errors could damage trust; the agentic AI framework emphasises human accountability, controls and transparency (Ministry of Digital Development and Information [MDDI], 2026)

Source: group analysis based on cited sources.

Exhibit 5: TOWS matrix linking the internal analysis to strategy

Internal factor	**Opportunities**	**Threats**
Strengths	S–O: Promote Grab AI within the app to existing users and use local data to make recommendations more relevant.	S–T: Emphasise that Grab AI can complete bookings and orders within Grab; provide a clear confirmation step before payment.
Weaknesses	W–O: Use demonstrations, Early Access members and community sessions to raise awareness and collect feedback on users' needs.	W–T: Introduce the features in stages, disclose AI use and resolve errors promptly, including refunds where appropriate.

Source: group analysis, adapted from Weihrich (1982).

4. Objectives and Strategy (Joshua)

– SMART objectives
– STP (Segmentation, Targeting, Positioning)

4.1 SMART Objectives

To support Grab AI Assistant's market penetration strategy in Singapore, four SMART marketing objectives are proposed for the 12-month period.

1. Q1 - Reach 500,000 unique Singaporean Grab users through digital marketing campaigns within the first three months to strengthen awareness of Grab AI Assistant.
2. Q2 - Achieve a 25% first-time trial rate among targeted existing Grab users by the end of Month 6.
3. Q3 & Q4 - Increase monthly active Grab AI Assistant users by 30% compared with the initial baseline by the end of Month 12.
4. Q4 - Achieve a 30% repeat-usage rate within 30 days among first-time users by the end of Month 12.

Together, these objectives aim to improve consumer awareness and encourage new and recurring usage of Grab's existing AI-powered service.

4.1.1 Specific

By targeting existing customers who are regular Grab users, we lower the cost of acquiring a new customer who has not used Grab before. Existing customers have a higher likelihood of purchasing additional products or services. They are more likely to be more receptive to new offers. (Girish, M, 2024)

4.1.2 Measureable

Measurable targets by each quarter aligns with the Key Performance Indicators (KPIs) that we will be setting for this campaign. It is important to keep track on the quarterly performance of the campaign so that the team will be able to adjust any plans accordingly instead of keeping a singular approach and hoping for a different outcome. “The goal of KPIs is to communicate results succinctly to allow management to make more informed strategic decisions,” (Twin, A, 2026).

4.1.3 Achievable

According to Yew (2024), almost 41% of Singapore's population of 6 million people use Grab to hail rides and order food. Given this base figure, 500,000 unique users reached within the first three months of our targeted marketing campaign represents an achievable target number considering the wide usage of digital platforms and digital marketing by Singaporeans.

4.1.4 Relevant

The proposed objectives align with Grab's market penetration strategy by encouraging existing customers in Singapore to adopt its AI Assistant. Increasing awareness and repeated usage could strengthen customer engagement while creating more opportunities for transactions within Grab's existing ecosystem.

4.1.5 Time-bound

The 12 month marketing campaign is the time limit and within that time frame, updates and progress status is required to ensure the campaign is progressing smoothly and in the right direction. This also allows the team to pivot and change certain strategies in order to improve the overall marketing campaign. "Establishing deadlines helps ensure that our actions are purposeful and void of procrastination." (Schmitz, T, 2023)

4.2 Segmentation, Targeting, Positioning

Using Rogers' (2003) adopter categories, we placed Grab's Singapore users into four segments based on their perceived attitude towards new features and technology.
The groups are:

- Everyday users who frequently use Grab to order food and groceries and transportation, such as working adults or parents.
- Tech savvy enthusiasts who often try new technology features and share their experiences with other enthusiasts and communities.
- Senior citizens or users who may find the Grab application difficult to navigate or unfamiliar.
- Infrequent users who rarely use Grab unless influenced by others or on specific occasions.

Exhibit 6: Segment Evaluation

Segment	Size and growth	Accessibility	Competition	Adaptation cost	Decision
Everyday Users	Large, growing	High (in–app)	High (habit)	Low to medium	Primary target
Unfamiliar Users	Medium, growing fast	Medium (phone, community sessions)	Low	Medium (more languages)	Secondary target
Tech Enthusiasts	Small, likely to try first	High	Moderate	Low	Advocates, not targets
Infrequent Users	Large, slow	High	High (habit)	High (needs proof)	Not targeted in 2027

4.2.1 Segmentation

The segmentation that we will focus on is mainly adults between 21 to 65 whose main psychographics are that they want to use technology to streamline their lifestyle. Their primary need stems from having to do multiple activities in a day such as travel, taking care of meals for their loved ones or themselves, or that they have no time to do it themselves.

4.2.2 Targeting

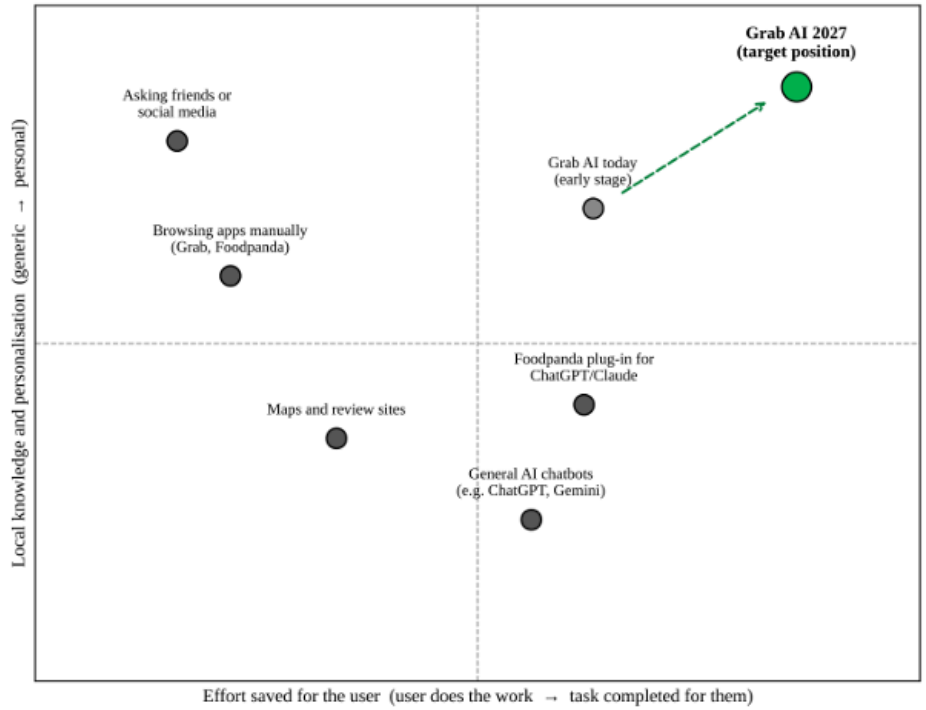

We will use differentiated marketing strategies for the two target markets.
For the primary target market, Everyday Users like regular working adults, they are users who use Grab often for food deliveries and ride hailing services. They require less effort to introduce the Grab AI to them, provided it is beneficial to them to automate their lifestyle.

For the secondary target market, Unfamiliar Users like senior citizens, the value proposition is that the AI will be able to help them to do tasks without the users having to click into each page manually, which assists their issue of being unfamiliar with the user interface of Grab. This is also supported by Start.io's (2026) insight that the majority of users on Grab are aged 55 years and above.

For the Tech Enthusiasts, they are likely to try the feature by themselves and advocate or provide feedback for it to their community. Infrequent users are less likely to be motivated to try the new features considering they do not use Grab on a frequent basis to begin with. Hence, we will focus on these two groups at a later stage in adoption.

4.2.3 Positioning

Exhibit 7: Perceptual map of ways to discover and order everyday services in Singapore

Source: group assessment. Positions are indicative and based on publicly available information.

The positioning statement we have is: "Grab AI is a personal assistant who has local and up-to-date knowledge and completes tasks for you. Other chatbots may only provide recommendations or suggestions, leaving you to confirm the final step. Grab AI helps you through the whole process from the first instruction to the delivery at your doorstep."

For example, general chatbots like ChatGPT or Gemini may only provide recommendations for food based on the highest reviewed restaurant on Google Reviews. These reviews could have been made years ago, and changes to the restaurant or food quality may have changed. However, Grab AI has the latest information from order, delivery and review statistics in the past 6 months. This would speak more to the current quality of the restaurant rather than relying on possibly outdated information.

Other services also do not provide the option to complete a task fully such as placing a food delivery order and payments. For example, Foodpanda's plug-in still sends users to another platform to check out their order. Grab AI can position as the one-stop-shop where it is able to source, pay, and deliver the order based on its initial instructions.

The main point of difference is the combination of local, recent knowledge and task completion. Accuracy, privacy and safety are points of importance, and Grab AI need to meet these expectations for customers to trust it with their money.

5. Marketing Tactics and Implementation (Fariz)

The extended 7Ps marketing mix provides a suitable framework for Grab AI Assistant as it addresses both marketing activities and service delivery (Rafiq and Ahmed, 1995).

5.1.1 Product

Grab AI Assistant is an AI-powered conversational service within the Grab app that helps users discover restaurants and receive personalised food recommendations. It also allows users to make dining reservations through natural-language interactions (Grab, 2026). To support market penetration, interactive in-app demonstrations could showcase the service's practical benefits. Guided tutorials would also help existing customers become more familiar with its features, encouraging wider adoption.

5.1.2 Price

Instead of charging a separate fee for AI Assistant access, Grab could encourage first-time usage through promotional vouchers. Customers who complete eligible transactions using the service would receive discounts as an incentive. These monetary benefits can influence consumer purchasing behaviour (Chandon, Wansink and Laurent, 2000). However, such promotions should be offered selectively to manage costs without compromising profitability.

5.1.3 Place

Grab uses a direct digital distribution channel through its existing mobile application in Singapore. Prominent homepage placement and contextual prompts within GrabFood could improve the AI Assistant's visibility. This allows Grab to reach existing customers without relying on additional distribution channels. Simplifying access is particularly relevant to technology adoption, where ease of use influences consumer acceptance (Venkatesh et al., 2003).

5.1.4 Promotion

An Integrated Marketing Communications (IMC) strategy will combine TikTok and Instagram influencer campaigns with targeted in-app promotions. Influencer credibility can shape consumer purchasing decisions (Djafarova and Rushworth, 2017). Following the AIDA model, influencer content will capture attention and practical demonstrations will build interest. Exclusive vouchers can then create desire, while in-app prompts encourage users to take action.

5.1.5 People

Customer trust plays an important role in the adoption of AI-powered services. To strengthen confidence in Grab AI Assistant, customer service personnel could be equipped to assist users facing difficulties. Collaborating with merchant partners may further encourage engagement, while transparent communication and user feedback can help address concerns about AI reliability (NIST, 2023).

5.1.6 Process

A smooth user experience is important in encouraging customers to use Grab AI Assistant regularly. Simple navigation and guided prompts could help users interact with the service more easily. Customer feedback would also allow Grab to identify areas for improvement and provide a better overall experience (Lemon and Verhoef, 2016).

5.1.7 Physical Evidence

The Grab app serves as the main visual representation of its AI Assistant service. Grab's use of AI-driven design tools reflects its efforts to improve digital design and user experience (Jean, 2025). A simple, intuitive interface would make the service easier to navigate, while clear booking confirmations could reassure customers that their requests have been processed successfully.

5.2 Proposed Marketing Campaigns

1. “Ask Grab” Awareness Campaign

Short TikTok and Instagram videos featuring local influencers will demonstrate how Grab AI Assistant helps users discover restaurants and decide what to eat.

2. “Try AI, Earn Rewards!” Trial and Adoption Campaign

First-time users who complete eligible transactions through the AI Assistant will receive promotional vouchers, encouraging them to explore its features.

3. “Your Everyday AI Companion” Retention And Usage Campaign

Personalised in-app reminders and seasonal promotions will encourage existing users to return to the AI Assistant, building familiarity and long-term engagement.

5.3 One Year Implementation Timeline

The 12 months implementation follows the AIDA model, guiding consumers from attention and interest towards desire and action. Promotional activities will gradually shift from building awareness to encouraging adoption and repeated usage. The final quarter extends beyond AIDA by focusing on customer retention and evaluating campaign effectiveness, as illustrated in Exhibit 8.

Exhibit 8: Implementation Timeline			
Period	**AIDA Stage**	**Campaign**	**Key Activities**
Q1 (Month 1 -3)	Attention	Ask Grab	Launching TikTok and Instagram Influencer campaign to raise awareness of Grab AI Assistant.
Q2 (Month 4-6)	Interest & Desire	Try AI, Earn Rewards!	Introduce daily usage by vouchers and targeted in app promotions to encourage adoption.
Q3 (Month 7-9)	Desire & Action	Your Everyday AI companion	Promote personalised recommendations and seasonal offers to encourage repeated usage.
Q4 (Month 10-12)	Action & Retention	Retention &	Re Engage inactive

		Evaluation	users by gathering feedback and evaluate campaign performance against KPI.

5.4 KPIs & Evaluation

Campaign effectiveness will be measured through KPIs aligned with the proposed SMART objectives. In Exhibit 9, the key measures include campaign reach and first-time adoption, while transaction conversion rates will assess actual business outcomes. Each quarterly review will be conducted to monitor campaign performance targets and identify areas requiring improvement. Based on these findings, marketing activities may be adjusted to improve campaign effectiveness.

1st Quarter – Awareness: Campaign reach will be evaluated against the target of 500,000 unique users. If results fall short, Grab may revise its advertising content or allocate more resources to effective channels.

2nd Quarter – Adoption: First-time trial rates will be assessed to determine whether promotional vouchers successfully encourage adoption. Underperformance may require adjustments to incentives or improvements to user onboarding.

3rd Quarter – Engagement: Monthly active users will be monitored to assess whether customers continue using the AI Assistant. User feedback could help identify barriers affecting engagement.

4th Quarter – Retention: The final review will evaluate repeat usage and transaction conversion. Findings will determine whether the marketing objectives were achieved and guide future campaign improvements.

Exhibit 9: Quarterly KPI Monitoring and Evaluation		
KPI	**Proposed Target**	**Measurement Method**
Campaign Reach	500,000 users by Q1	Calculate Grab users exposed to the campaign
First timer Trial Rate	25% by Q2	First time AI users / eligible

		targeted users *100
Monthly Active Users	30% growth by Q4	Compare Month 12 active users against initial baseline
30 Day Repeat Users	30% by Month Q4	Users returning within 30 Days / eligible first time users * 100
AI Assisted Transaction Conversion Rate	Supporting KPI: to be confirmed	Completed AI assisted transactions / eligible AI sessions * 100

6. Conclusion & Integration

In conclusion, Grab AI Assistant presents an opportunity to strengthen Grab's position in Singapore's digital services market. Through Ansoff's Market Penetration strategy, the proposed marketing plan focuses on increasing awareness, encouraging adoption and building long-term engagement among existing customers.

Ultimately, the success of this plan depends on how effectively Grab converts initial interest into regular usage. By aligning its marketing activities with customer needs and continuously evaluating performance, Grab can encourage wider adoption of its AI Assistant while strengthening customer relationships in Singapore.

APPENDIX 1: TEAM AGREEMENT FOR GROUP 4

Date: ____03 October 2026_____ **Module:** BBS69 MADE (MKT2002S)

Team Members and Contact Details

No.	Team member	Mobile	Email
1	Fariz Irwan	91878575	fariz.binjoanis@ucdconnect.ie
2	Dion Long De En	98194026	dion.deen@ucdconnect.ie
3	Joshua Brian Khoo Kay Vinn	92291368	joshua.kayvinn@ucdconnect.ie
4	Samrudhi Ekhande	88916414	ekhande.samrudhi@ucdconnect.ie
5	Ratchumari Suhith	90102442	ratchumari.suhith@ucdconnect.ie

INFORMAL COMMUNICATION

1) We agreed to use our WhatsApp group for day-to-day updates, questions and progress sharing.

2) We agreed to keep working files and references in a shared folder with clear file names.

3) We agreed that members should acknowledge important messages within 24 hours where practical and flag delays early.

MEETINGS

1) We agreed to hold weekly online or in-person progress meetings, with additional meetings near deadlines when necessary.

2) We agreed that members would come prepared with updates on completed work, outstanding tasks and difficulties.

3) We agreed that Fariz Irwan would serve as the group leader, responsible for coordinating meetings, monitoring progress and overseeing the final integration of the group assignment.

MAKING DECISIONS

1) We selected Grab AI Assistant in Singapore as our project topic and Ansoff's Market Penetration as our growth strategy.

2) We allocated responsibility for individual sections and agreed to coordinate where sections depended on one another.

3) We agreed to discuss major decisions openly, seek consensus and use a simple majority vote if consensus could not be reached.

4) We set internal deadlines ahead of the official submission date to allow time for review and editing.

5) All members reviewed the final submission for consistency, referencing, academic integrity and compliance with the assignment brief.

SANCTIONS

1) We agreed that members unable to meet a deadline would inform the group promptly and agree on a recovery plan.

2) We agreed that repeated non-participation would be discussed respectfully and that corrective actions would be documented.

3) We agreed to seek guidance from our tutor promptly if a serious issue could not be resolved within the group.

PROPOSED WORK ALLOCATION

- Suhith: Introduction, company background and Ansoff justification
- Sam: External situational analysis (PESTLE and Porter's Five Forces)
- Dion: Internal analysis and consolidated SWOT
- Joshua: SMART objectives, STP and marketing strategy
- Fariz: Group Leader, Marketing mix 7P's, 12-month timeline and KPIs, Overall report coordination and final review.
